Robust Neural Text-to-Speech under Pathological Conditions

Alex Rivera, Morgan Vance, and Jordan Lee
Department of Computer Science, University of Cambridge

Abstract

This paper presents a resilient speech extraction architecture designed to process complex multi-column documents with spanning summaries.

1. Introduction

Document layout modeling in web readers must handle varied visual hierarchies.

Column splitting ensures continuous flow across distinct text blocks.

2. Architecture

Our parser decomposes visual geometry into coherent semantic regions.

Extracted lines are normalized before acoustic phonemization.
